INTRODUCTION

In 1989 the Bonneville Power Administration (BPA) began funding the evaluation of production groups of juvenile anadromous fish not being coded-wire tagged for other programs. These groups were the "Missing Production Groups". Production fish released by the U.S. Fish and Wildlife Service (USFWS) without representative coded-wire tags during the 1980's are indicated as blank spaces on the survival graphs in this report.

The objectives of the "Missing Production Groups" program are:

- to estimate the total survival of each production group,
- to estimate the contribution of each production group to various fisheries, and
- to prepare an annual report for all USFWS hatcheries in the Columbia River Basin.

Coded-wire tag recovery information will be used to evaluate the relative success of individual brood stocks. It can also be used by salmon harvest managers to develop plans to allow the harvest of excess hatchery fish while protecting threatened or endangered stocks.

In order to meet these objectives, a minimum of one marked group of fish is necessary for each production release. The level of marking varies according to location, species, and age at release. In general, 50,000 fish are marked with a coded-wire tag (CWT) to represent each production release group at hatcheries below John Day Dam. Between 120,000 and 200,000 fish are marked for groups at hatcheries above John Day Dam.

All fish release information, including marked/unmarked ratios, is reported to the Pacific States Marine Fisheries Commission (PSMFC). Fish recovered in the various fisheries or at the hatcheries are sampled to recover coded-wire tags. This recovery information is also reported to PSMFC.

RESULTS

In calendar year 1995 the USFWS, Columbia River Fisheries Program Office marked 1,076,237 fish as "Missing Production Groups". Totals per group are listed in Table 1. Over 550 snouts with "Missing Production Groups" coded-wire tags were recovered at USFWS hatcheries in 1995, and processed at USFWS fisheries offices.

A brief description of the estimated survival and contribution for each species raised at National Fish Hatcheries follows. Graphs for each hatchery and species were prepared, and summaries of release and recovery information are also included in this report.

Abernathy Salmon Culture Technology Center

Abernathy Salmon Culture Technology Center (SCTC) is located 14 miles west of Longview, Washington, on Abernathy Creek, approximately 3 miles upstream from its confluence with the Columbia River. The center was constructed in 1959. At present, lower river tule fall chinook are the only species reared on a production basis at Abernathy.

There were no releases of marked fish for brood years 1983 to 1987 from Abernathy. Marking fish with coded-wire tags was resumed for brood year 1989 under the missing production group program.

Brood year 1989 contributed mainly to troll and sport fisheries in Washington and British Columbia. Overall survival was 0.1836%.

Carson National Fish Hatchery

Carson NFH is located 13 miles northwest of Carson, Washington at the confluence of the Wind River and Tyee Springs (River Mile 18), at 1,180 feet above sea level. Carson NFH began operation in 1938 by rearing and releasing fall chinook salmon and trout. In 1956, the hatchery was remodeled under the Mitchell Act. Construction of a fish ladder at Shipherd Falls (River Mile 2.1) made it possible for spring chinook to pass upstream to the hatchery. Current production involves adult collection, egg incubation and rearing of spring chinook salmon.

Brood 1983 to 1985 spring chinook from Carson were marked with coded-wire tags for a density study. The average survival of these broods is 0.22%. These fish were recovered mainly in the freshwater sport fishery.

Brood year 1988 from Carson had an overall survival rate of 0.3999% estimated using 75 total tag code recoveries. The majority of those recoveries were in the Columbia River freshwater sport (5,303) and treaty ceremonial fisheries (1,023). There were an additional 20 recoveries since the 1994 report.

Brood year 1989 was tagged as part of an otolith study conducted by Washington Department of Fish and Wildlife (WDFW). The current overall survival rate is 0.1263%. The great majority of fish (2,349) were taken in the freshwater sport fishery reported by WDFW. There was one observed recovery in the ocean troll fishery off Washington.

Dworshak National Fish Hatchery

Dworshak NFH is located at the confluence of the North Fork Clearwater River and the main stem Clearwater River about 3 miles west of Orofino, Idaho. Dworshak NFH first began operations in 1969 rearing summer steelhead and resident trout. The facility was expanded in 1982 under the Lower Snake River Compensation Program (LSRCP) to rear spring chinook salmon. The hatchery is now used to produce spring chinook and summer steelhead.

Spring Chinook

No marked groups of spring chinook were released at the hatchery for broods 1983 to 1987.

The number of fish released for brood 1988 has been increased from 1,192,457 to 1,252,014 based on information from the StreamNET database. The StreamNET database is a BPA funded interagency effort to organize fisheries data. All StreamNET derived information was checked against the PSMFC tag book, tag code by tag code. Overall survival was 0.0624%, and this brood contributed mainly to the treaty ceremonial fishery in the Columbia River.

A release of unmarked fingerlings at Hog Island was reported to the CRiS database in 1991, but is not listed in the StreamNET database. The inclusion of tag code 103025 this year added a few observed recoveries, but decreased the Production Expansion Factor. Yearlings from brood year 1989 didn't do as well as brood 1988. An estimated 60 fish were harvested in the Columbia Basin, and 3 were recovered at WDFW hatcheries. Forty-two fish were taken in the treaty ceremonial fishery. Overall survival was 0.0306%.

Summer Steelhead

Brood 1986 summer steelhead released at the hatchery were marked with coded-wire tags for evaluation. The steelhead had an overall survival of 1.9302% and contributed mainly to the freshwater sport fishery in Idaho. Many of these steelhead were also recovered in the Columbia River gillnet fishery.

Summer steelhead from brood 1987 survived at an overall rate of 0.9450%. Thirty-five fish were taken off British Columbia, but the great majority of fish (7,552) were taken in the Columbia River Basin. The majority of "Columbia River" harvest was in the Oregon Department of Fish and Wildlife (ODFW) reported gillnet fishery and the Idaho Department of Fish and Game (IDFG) reported freshwater sport fishery.

Brood year 1988 summer steelhead yielded 465 observed recoveries with an overall estimated survival rate of 0.5088%. The vast majority of fish were taken in the Columbia River gillnet fishery (2,387), followed by the Columbia River sport fishery (655). An

estimated contribution of 21 squid gillnet by-catch and foreign research vessel recoveries don't show up on the Ocean Contribution section of the Stock Assessment Reference Document. The StreamNET database has no listed off station releases for brood 1988.

An additional 43 recoveries reported by USFWS raised overall survival to 0.9494% for brood year 1989. Most fish were taken in the Columbia River gillnet fishery (4,566). Forty-one of those fish went to the treaty ceremonial fishery in the Columbia River. Forty-seven fish were taken off the coast of British Columbia.

The StreamNET database lists a total of 3,509,190 brood 1990 steelhead released by Dworshak NFH, including 739,459 to the Salmon River.

Eagle Creek National Fish Hatchery

Eagle Creek National Fish Hatchery (NFH) is located about 7 miles from Estacada, Oregon on Eagle Creek, approximately 8 miles above its confluence with the Clackamas River. The hatchery was constructed in 1956 under the Columbia River Fishery Development Program (CRFDP). Even though Eagle Creek NFH has raised fall and spring chinook in past years, production is now limited to coho and winter steelhead.

Coho

Three additional recoveries for 1989 brood coho increased the overall survival rate to 0.9446%, less than the 4.181% survival of brood year 1988 coho. Over 3,800 of the coho from this brood year were caught off the Oregon coast in the sport and commercial fisheries. Eighteen hundred were harvested in the ocean off Washington, and 200 off California. Two hundred plus fish were taken in British Columbia. Eight hundred twenty were also harvested in the Columbia River.

Brood year 1990 coho now has a total of 31 observed recoveries and an overall survival of 0.1228%. Fewer than 600 fish were taken in the ocean, and 300 in the Columbia River. Five hundred of the ocean recoveries were reported by WDFW. The remaining 96 were split evenly between Oregon and California.

Total survival for brood year 1991 coho is estimated to be 0.338%. Slightly over 100 fish were harvested in the ocean (91 by British Columbia and 23 by Washington), and 205 in the Columbia River. Escapement to the hatchery was about 3,200 fish. Although this brood did better than the 1990 fish, it was much less successful than 1988 or 1989.

Winter Steelhead

Eight fish from brood year 1989 winter steelhead were recovered off station. Total estimated survival was 0.7689%.

Only 7 fish were caught off station from brood 1990, and the overall survival rate was 0.2993%.

An estimated 28 fish from brood 1991 have been taken in the ODFW reported freshwater sport fishery. Additional recoveries are listed in the "1994 Accomplishment Report for Clackamas River Fisheries Working Group", but did not make it into the PSMFC database.

Entiat National Fish Hatchery

Entiat NFH is located on the Entiat River, east of Entiat, Washington. Construction began in 1940 under authorization of the Mitchell Act and operations began a year later. Present production at the hatchery consists of adult collection, egg incubation, and rearing of spring chinook salmon.

Beginning with brood 1988, yearling spring chinook at Entiat were coded-wire tagged under the missing group program. Expanded off station recoveries include 57 in the treaty ceremonial fishery and 6 in the Columbia River sport fishery. Expanding CWT recoveries for brood year 1988 gave an estimated survival of 0.1023%. Eggs from Winthrop NFH were raised and released at Entiat as part of this brood.

There was a total of 56 observed recoveries of the 111,207 tagged fish released with brood year 1989. Expansion of these recoveries yields an overall survival rate of 0.0503%. Seven fish were taken in the Columbia River sport fishery. Eggs from Leavenworth NFH were raised and released at Entiat as part of this brood.

Kooskia National Fish Hatchery

Kooskia NFH is situated along Clear Creek, just upstream of the confluence with the Middle Fork Clearwater River. It is located approximately 75 miles southeast of Lewiston, Idaho. The hatchery was authorized in 1961 and is currently used for adult collection and rearing of spring chinook salmon.

Only two broods during the 1980's received tag codes at Kooskia. An age 0 release of brood 1980 fish contained an IDFG tag code. Fish raised at Kooskia were released at Dworshak NFH with an IDFG tag code. Fish from Hagerman NFH were released at Kooskia in 1983.

Brood 1988 fish at Kooskia were the first fish to be marked under the Missing Production Group program. Total survival for brood 1988 was 1,080 fish, or 0.2675%. Treaty ceremonial fishing took most of the fish harvested off station (155). Eighteen fish were also taken in the ODFW test fishery net. Information for this one brood was not graphed.

Neither CRiS nor PSMFC has any record of tagged fish being released with brood 1989.

Leavenworth National Fish Hatchery

Leavenworth NFH is located about 4 miles northeast of Leavenworth, Washington along Icicle Creek, a tributary to the Wenatchee River. The hatchery was originally authorized in 1937 by the Grand Coulee Fish Maintenance Project and was re-authorized in 1938 by the Mitchell Act. The facility began operations in 1942 and is currently used for the production of summer steelhead and spring chinook salmon.

None of the summer steelhead at Leavenworth are marked with a coded-wire tag. Additional recoveries for the 1987 brood of spring chinook salmon released as yearlings brings the total estimated survival up to 0.2788%. Off station recoveries were mainly in the freshwater sport fishery and treaty ceremonial fishery. Nearly 3,000 fish were taken in the Columbia River. One tag was recovered in the British Columbia ocean troll fishery, which was expanded to 28 fish. The 1987 brood spring chinook released as fingerlings survived at a rate of only 0.0030%.

Brood 1988 spring chinook fared quite a bit better than brood 1987 with an estimated survival rate of 0.4751. Most fish were taken in the freshwater sport fishery (3,469). In addition, ODFW reported a treaty ceremonial harvest of 1,315. Fingerling releases from this brood year survived at an overall rate of only 0.0034%. There were only 7 observed recoveries from a release of nearly 300,000.

An agency 63 tag code was released with brood 1989 age 0 Leavenworth fish raised at Wells SFH and returned to Leavenworth. These fish survived at a rate of 0.0889%. Thirteen fish were harvested in the British Columbia ocean troll fishery, 163 in the freshwater sport fishery, and 66 in the treaty ceremonial fishery.

Yearling fish from brood 1989 survived at a rate of 0.1919%, more than twice the rate for fish released at age 0. The great majority of off station recoveries occurred in the Columbia River sport fishery (1,429). An additional 360 fish were taken in the treaty ceremonial fishery.

Little White Salmon National Fish Hatchery

Little White Salmon NFH is located on the Little White Salmon River, 12 miles east of Stevenson, Washington. The hatchery was originally built in 1898 and was remodeled and expanded in 1958. Now operating as part of the CRFDP, hatchery production consists of rearing upriver bright fall chinook and spring chinook salmon. Willard NFH is administered by Little White Salmon, but listed separately in this document.

Spring Chinook

Both age 0 and yearling spring chinook have been released from the hatchery. Brood years 1982 through 1984 were coded-wire tagged to evaluate age 0 and yearling releases. Average survival for age 0 fish was 0.11%, compared with an average survival of 0.39% for yearling releases.

Marking of spring chinook was resumed for brood year 1988 under the Missing Group Program. Brood year 1988 fish released at age 0 were not marked. Additional recoveries in the WDFW freshwater sport fishery raised the overall survival rate to 1.0458%. Nearly 2,400 yearling release fish were harvested in the Columbia River, with over 1,500 in the WDFW reported freshwater sport fishery alone. Another 731 fish were taken in the treaty ceremonial fishery.

Brood 1989 shows a total survival of 2,145 fish, or 0.2110%. Over 1,100 fish were taken in the freshwater sport fishery, and 85 in the treaty ceremonial fishery. Age 0 fish were released from this brood, but were not coded-wire tagged.

Upriver Bright Fall Chinook

Brood year 1983 through 1985 upriver brights were marked for both a normal age 0 release and an extended rearing release. Average percent survival for the fingerling release was 1.1%, compared to the survival of 0.38% for the extended rearing fish. Extended rearing for upriver brights is no longer being used.

Brood 1989 was the first upriver bright brood to be marked under the missing production group program. Seventy-three observed recoveries were expanded to a total of 4,527 for an overall survival rate of 0.3147%. Most of the harvested fish were taken in the ocean (2,408), with 1,124 in Alaska, 1,059 in British Columbia and 225 in California. An additional 1,092 fish were harvested in the Columbia River gillnet fishery, or counted in spawning ground surveys.

Spring Creek National Fish Hatchery

Spring Creek NFH is located on the Columbia River at Underwood, Washington, about 30 miles upstream of Bonneville Dam. The hatchery was constructed in 1900 and began operations a year later. Spring Creek NFH was remodeled in 1955 under the Mitchell Act and currently produces tule fall chinook.

Brood year 1987 fall chinook were recovered primarily in commercial fisheries off the coasts of Canada and Washington as well as in the Columbia River gillnet fishery. Survival of the 1987 brood year was 0.2997%.

Brood year 1988 fish were recovered primarily in the Columbia River gillnet fishery (23,218). They also contributed to the ocean fisheries in Washington (16,006), Canada (11,934), and Oregon (5,537). Overall survival was 0.5135%.

Fish from brood 1989 fared slightly worse than brood 1988 with an overall survival of 0.4516% or 46,211 fish. The greatest number of recoveries was in the ocean off Washington (14,339), and in the Columbia River (10,107). The Columbia River gillnet fishery took the great majority of fish harvested in the Columbia River. British Columbia took 8,617 fish, and ocean recoveries off Oregon totaled 3,179.

Warm Springs National Fish Hatchery

Warm Springs NFH is located on the Warm Springs River, approximately 14 miles north of Warm Springs, Oregon. The hatchery was authorized in 1966 and began operations in 1978. The Confederated Tribes of the Warm Springs Indian Reservation of Oregon entered into an agreement with the USFWS to increase tribal fishing opportunities. Operations at the hatchery presently consist of adult collection, egg incubation and rearing of spring chinook salmon.

The 1987 brood of spring chinook is the first group of fish coded-wire tagged since the late 1970's. Since then, every fish released from the hatchery has been marked. The 1987 brood spring chinook had a 0.1401% survival and contributed mainly to the freshwater sport fishery on the Deschutes River.

Brood 1988 survived at a rate of 0.1833%, slightly better than brood 1987. They contributed primarily to the freshwater sport fishery in Oregon and the treaty fisheries in both the Columbia River and Deschutes River.

Total survival for brood year 1989 was only 221 fish, or 0.0206%. Sixty-two fish were taken in the freshwater sport fishery, 11 in treaty subsistence, and 5 in treaty ceremonial.

For specific information concerning ongoing studies at Warm Springs NFH refer to "Warm Springs National Fish Hatchery Evaluation and Anadromous Fish Study on the Warm Springs Indian Reservation of Oregon" progress reports.

Willard National Fish Hatchery

Willard NFH is situated 4 miles upstream of Little White Salmon NFH on the Little White Salmon River, and is part of the Little White Salmon NFH complex. Willard NFH was constructed in 1952 under authorization of the Mitchell Act and was originally planned as a fall chinook hatchery. The hatchery was switched to a spring chinook and coho facility because of cold water temperatures. Since the mid-1960's, the hatchery has been used primarily for coho production. Adult coho are trapped and spawned at Little White Salmon NFH.

Fish from brood 1988 contributed mostly to ocean fisheries (27,996 fish) from British Columbia to California. An additional 8,776 fish were harvested in the Columbia River. Total survival rate was estimated to be 1.6976%.

Brood 1989 coho survived at a rate of 0.32%. They contributed mainly in ocean sport fisheries of Oregon and Washington.

Total survival for brood 1990 was only 1,726 fish or 0.1100%. Fish were harvested off the coasts of Washington, Oregon and California. One hundred twenty-eight fish were taken in the Columbia River Sport fishery.

Brood 1991 was even grimmer than 1990 with an overall survival of 0.0721%, or 2,209 fish from a release of over three million smolts. The only fish harvested from this brood were 552 fish taken in the Columbia River.

Winthrop National Fish Hatchery

Winthrop NFH is situated along the Methow River, near the town of Winthrop, Washington. The facility began operations in 1942 by trapping adult sockeye, chinook, and steelhead at Rock Island Dam and transporting them to the hatchery. By 1951 the hatchery was rearing sockeye, chinook, steelhead, kokanee, coho and resident trout. Until this year the program had been simplified to spring chinook only.

Spring chinook were coded-wire tagged beginning with brood year 1989. There were 16 observed recoveries from the 107,670 tagged fish released. These recoveries are expanded to a total of 225 fish for an overall survival rate of 0.0213%. An estimated 78 fish were recovered in the freshwater sport fishery, and an estimated 29 fish were recovered by WDFW hatcheries.

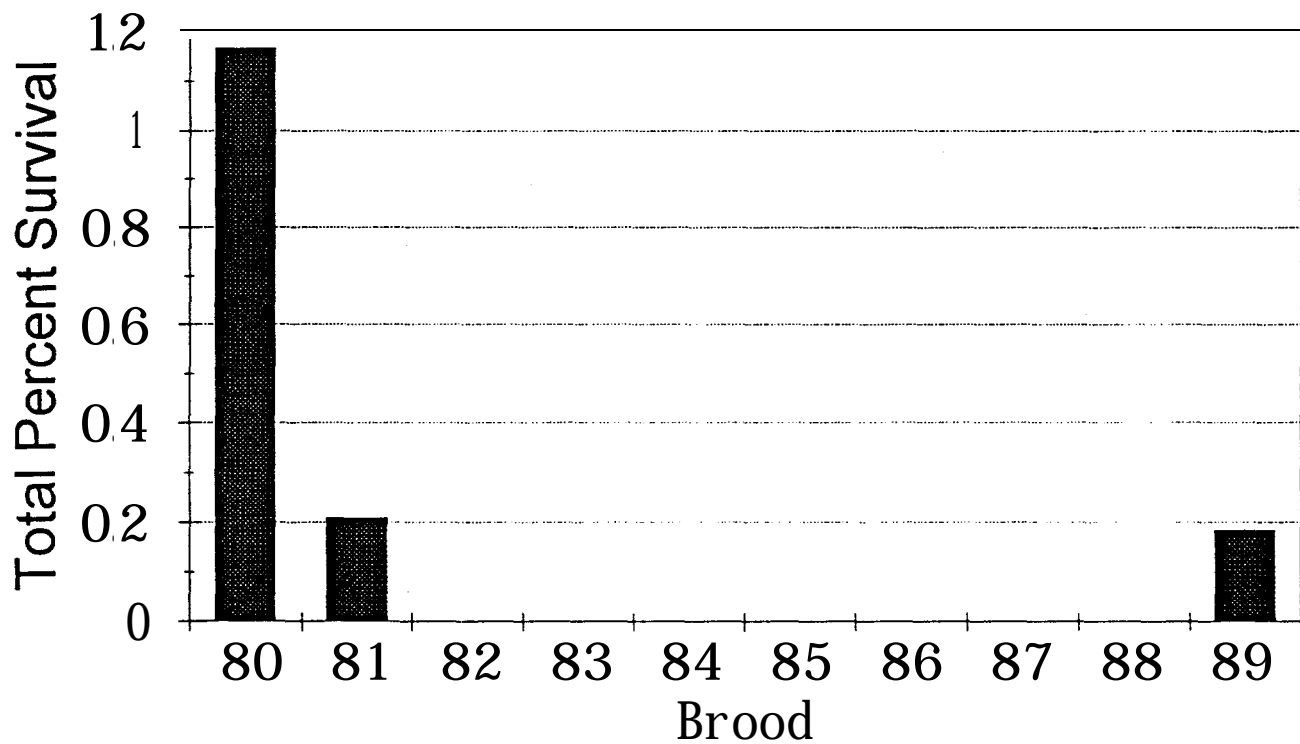

There are no recoveries for brood 1990 Winthrop spring chinook on file with PSMFC, indicating a very low survival rate. Over ninety thousand tagged fish were released as yearlings.

Table 1 - Fish Marked as Missing Production Groups in Calendar Year 1995
